INTRODUCTION: THE COSMIC WISDOM OF THE JENU KURUBAS

In the dense forests of the Western Ghats in Karnataka, India, lives one of the oldest indigenous communities – the Jenu Kurubas. Traditionally hunter-gatherers and honey collectors, the Jenu Kurubas have nurtured a rich oral tradition that includes a unique understanding of the universe. The **Space And Cosmology Of Jenu Kurubas Indian Folklore** is not merely a set of myths; it is a living knowledge system that blends observations of nature, celestial phenomena, and spiritual beliefs. This article explores how this tribal community envisions the cosmos, how they map the stars, and what their folklore reveals about the relationship between humans and the universe. By delving into their creation stories, astronomical observations, and rituals, we uncover a worldview that is both deeply rooted in the forest environment and strikingly sophisticated in its grasp of cosmic cycles.

WHO ARE THE JENU KURUBAS?

The Jenu Kuruba (literally “honey gatherers” in Kannada) are a Scheduled Tribe primarily found in the districts of Kodagu, Mysore, and Chamaranagar. **Jenu** means honey, and **Kuruba** refers to a shepherd or tribal group. Historically, they lived in harmony with the forest, relying on honey collection, small-game hunting, and shifting cultivation. Their oral literature, passed down through generations, encapsulates their encounters with the wild and the sky. The **Space And Cosmology Of Jenu Kurubas Indian Folklore** emerges from this intimate bond with nature – every hill, river, and constellation is woven into stories that explain the origins of life and the order of the heavens.

FOLKLORE AS A VESSEL FOR COSMIC KNOWLEDGE

Without a written script, the Jenu Kurubas depend on songs, dances, and storytelling to preserve their cosmology. Folktales about the sun, moon, and stars are not separate from their daily lives; they are used to teach children about seasons, navigation, and moral values. For instance, the appearance of certain star clusters signals the time to collect honey or to avoid certain forest areas. This practical astronomy is embedded in narratives that anthropomorphize celestial bodies – the sun is often a fiery deity, the moon a gentle grandmother, and the stars the campfires of ancestors. Such storytelling makes the **Space And Cosmology Of Jenu Kurubas Indian Folklore** accessible and memorable for generations.

Creation Myths: The Birth of the Sky and Earth

One of the most prevalent Jenu Kuruba creation myths describes a time when there was only water and darkness. A divine being – sometimes called *Booda Deva* (Earth God) – dived into the waters and brought up a handful of mud. From that mud, the earth was formed. The sky was believed to be a vast canopy held up by four pillars, each guarded by a spirit. The sun, moon, and stars were created from the sparks of a cosmic fire. This imagery of a structured universe, with layers of existence, is central to the **Space And Cosmology Of Jenu Kurubas Indian Folklore**. The earth is seen as a living entity, and the sky as a realm inhabited by gods and ancestors who influence human affairs.

The Role of the Milky Way

In Jenu Kuruba tradition, the Milky Way is known as *Hennu Bannu* (the woman’s path) or *Akkana Batti* (the elder sister’s trail). According to legend, a young woman named Akkamma was separated from her family while gathering honey. She wandered through the forest, and her footprints turned into clusters of stars that now form the Milky Way. The story teaches the importance of staying together and the dangers of straying from the community. This narrative is a classic example of how **Space And Cosmology Of Jenu Kurubas Indian Folklore** uses astronomical features to convey social lessons. The Milky Way is also used as a calendar: when it appears directly overhead at dusk, it marks the beginning of the honey-flow season.

UNDERSTANDING THE STARS AND CONSTELLATIONS

The Jenu Kurubas have names for many stars and constellations that differ from Western astronomy. Their celestial map is practical, tied directly to their livelihood. Below are some key examples from their folklore:

- **Kenda Nakshatra (The Fire Star):** This refers to the star Sirius. Its rising just before dawn is associated with the hottest part of the year, and it signals that it is time to avoid forest fires.
- **Mattu Moola (The Cattle Herd):** The Pleiades cluster is seen as a group of cows grazing in the sky. The disappearance of this cluster from the evening sky marks the beginning of the monsoon, a critical time for planting.
- **Kollu Navilu (The Black Eagle):** This is the constellation Aquila. The Jenu Kurubas believe that the eagle spirals in the sky to protect the

honeycombs on earth from being stolen by demons.

- **Mari Mannu (The Rain Girl):** The star Spica is personified as a girl who weeps, causing the rains to fall. Her appearance in the eastern sky at sunset is a sign that the rainy season is near.

These examples demonstrate how **Space And Cosmology Of Jenu Kurubas Indian Folklore** merges scientific observation – such as the timing of seasons – with mythological interpretation. The community does not separate the physical sky from the spiritual one; both are intertwined.

COSMOLOGY: THE LAYERS OF THE UNIVERSE

In Jenu Kuruba belief, the universe is divided into three main realms:

1. **Bhu Loka (Earth Realm):** The domain of humans, animals, and plants. It is considered sacred and is protected by *Kattale Devaru* (Forest God).
2. **Antar Loka (Intermediate Realm):** The region of the atmosphere, clouds, and birds. Spirits and minor deities dwell here.
3. **Deva Loka (Heavenly Realm):** The abode of the supreme god *Madeshwara* and the ancestors. The sun and moon travel through this realm, and the stars are the eyes of the departed.

These layers are not static; they interact through the movement of celestial bodies. For example, an eclipse is believed to occur when a serpent demon temporarily swallows the sun or moon, causing a disturbance between the realms. Rituals such as beating drums and shouting are performed during eclipses to scare the demon away, restoring cosmic order. This worldview highlights the dynamic nature of **Space And Cosmology Of Jenu Kurubas Indian Folklore**.

RITUALS AND FESTIVALS TIED TO CELESTIAL EVENTS

The Jenu Kurubas celebrate several festivals that align with astronomical phenomena. One of the most significant is *Belli Habba* (Silver Festival), observed during the full moon of the month of Vaisakha (April-May). Families gather in clearings, light bonfires, and offer honey and flowers to the moon, thanking it for guiding nocturnal journeys. The festival also involves recounting stories about the moon’s marriage to the earth, a narrative that explains the cycle of growth and decay in nature. Such rituals reinforce the community’s connection to the cosmos and ensure that the **Space And Cosmology Of Jenu Kurubas Indian Folklore** remains a lived experience rather than mere stories.

Another important event is the observation of the winter solstice, known as *Mukka Adugu* (Three Steps). On that day, the sun is said to step backward for three days before resuming its northward journey. The community performs a dance called *Kolatam* to mimic the sun’s motion, celebrating the return of longer days. This practice shows a deep understanding of the solar cycle, integrated into a cultural performance.

COMPARISON WITH MODERN ASTRONOMY

It is fascinating to note that many Jenu Kuruba observations align remarkably well with modern astronomy. Their identification of the Pleiades with the monsoon onset corresponds to the actual heliacal rising of that star cluster in that season. Their naming of Sirius as a fire star matches its association with the hottest period in the region. While the explanations are mythological, the empirical base is sound. The **Space And Cosmology Of Jenu Kurubas Indian Folklore** thus represents a form of indigenous astronomy that deserves recognition alongside other traditional knowledge systems. It also serves as a reminder that science and myth are not opposites; they are different ways of making sense of the world, especially in oral cultures.

CHALLENGES AND PRESERVATION

Today, the Jenu Kurubas face rapid cultural erosion due to deforestation, displacement, and modernization. Younger generations are moving away from traditional livelihoods, and the oral transmission of cosmic knowledge is weakening. However, efforts by anthropologists and local community leaders are underway to document and revive this unique cosmology. Projects that record folk songs and star names, and integrate them into school curricula, are helping to keep **Space And Cosmology Of Jenu Kurubas Indian Folklore** alive. Recognizing this knowledge as an intangible heritage is crucial for both cultural diversity and scientific appreciation of alternative worldviews.

CONCLUSION

The Space And Cosmology Of Jenu Kurubas Indian Folklore offers a profound example of how a forest-dwelling tribe has constructed a coherent, practical, and spiritually rich understanding of the universe. Their stars are not distant balls of gas but characters in moral tales; their seasons are not mere climate patterns but conversations between gods and ancestors. This cosmology teaches us that our relationship with the cosmos is not just a matter of scientific data but also of poetry, identity, and survival. By respecting and preserving such indigenous knowledge, we enrich our own understanding of the universe and the many ways humans have sought to find their place within it.
